Ex 14.1 Class 10 Maths Question 1.

A survey was conducted by a group of students as a part of their environment awareness programme, in which they collected the following data regarding the number of plants in 20 houses in a locality. Find the mean number of plants per house.

No. of plants	No. of houses
0 – 2	1
2 – 4	2
4 – 6	1
6 – 8	5
8 – 10	6
10 – 12	2
12 – 14	3

Which method did you use for finding the mean, and why?

Solution:

Number of plants	Class mark ( $x_i$ )	Number of houses ( $f_i$ )	$f_i x_i$
0 – 2	1	1	01
2 – 4	3	2	06
4 – 6	5	1	05
6 – 8	7	5	35
8 – 10	9	6	54
10 – 12	11	2	22
12 – 14	13	3	39
Total		$\Sigma f_i = 20$	$\Sigma f_i x_i = 162$

We have, Mean ( $\bar{x}$ ) =  $\frac{\Sigma f_i x_i}{\Sigma f_i} = \frac{162}{20} = 8.1$  plants. The mean of the data is 8.1.

Since the values of  $x_i$  and  $f_i$  are small, so we have used direct method to find the mean.

Ex 14.1 Class 10 Maths Question 2.

Consider the following distribution of daily wages of 50 workers of a factory.

Daily wages (in ₹)	No. of workers
100 – 120	12
120 – 140	14
140 – 160	8
160 – 180	6
180 – 200	10

Find the mean daily wages of the workers of the factory by using an appropriate method.

Solution:

In this case, we can use step-deviation method because the data is large.

Here,  $a = 150$  and  $h = 20$

Class interval	Frequency ( $f_i$ )	Class marks ( $x_i$ )	$u_i = \frac{x_i - a}{h}$	$f_i u_i$
100–120	12	110	-2	-24
120–140	14	130	-1	-14
140–160	8	150 = $a$	0	0
160–180	6	170	1	6
180–200	10	190	2	20
	$\Sigma f_i = 50$			$\Sigma f_i u_i = -12$

$$\begin{aligned} \therefore \text{Mean, } \bar{x} &= a + h \left( \frac{\Sigma f_i u_i}{\Sigma f_i} \right) \\ &= 150 + 20 \left( \frac{-12}{50} \right) = 150 - \frac{240}{50} \\ &= 150 - \frac{24}{5} = \frac{750 - 24}{5} \\ &= \frac{726}{5} = 145.20. \end{aligned}$$

Hence, mean daily wages of the workers are ₹ **145.20**.

The following distribution shows the daily pocket allowance of children of a locality. The mean pocket allowance is ₹ 18. Find the missing frequency  $f$ .

Daily pocket allowances (in ₹)	No. of children
11 – 13	7
13 – 15	6
15 – 17	9
17 – 19	13
19 – 21	$f$
21 – 23	5
23 – 25	4

Solution:

Daily pocket allowance (in ₹)	Class mark ( $x_i$ )	Number of children ( $f_i$ )	$d_i = x_i - 18$	$f_i d_i$
11 – 13	12	7	-6	-42
13 – 15	14	6	-4	-24
15 – 17	16	9	-2	-18
17 – 19	18 = $a$ (Let)	13	0	0
19 – 21	20	$f$	2	$2f$
21 – 23	22	5	4	20
23 – 25	24	4	6	24
Total		$\Sigma f_i = 44 + f$		$\Sigma f_i d_i = 2f - 40$

We have,  $\text{Mean} = a + \frac{\Sigma f_i d_i}{\Sigma f_i}$

$$\Rightarrow 18 = 18 + \frac{2f - 40}{44 + f} \quad [\because \text{Mean} = 18 \text{ (given)}]$$

$$\Rightarrow 0 = \frac{2f - 40}{44 + f} \Rightarrow 2f - 40 = 0 \Rightarrow 2f = 40 \Rightarrow f = \frac{40}{2} = 20$$

Find the mean number of mangoes kept in a packing box. Which method of finding the mean did you choose?

Solution:

Here  $h = 3$

Number of mangoes	Class mark ( $x_i$ )	Number of boxes ( $f_i$ )	$u_i = \frac{x_i - 57}{3}$	$f_i u_i$
50 - 52	51	15	-2	-30

62 - 64	63	25	2	50
Total		$\Sigma f_i = 400$		$\Sigma f_i u_i = 25$

We have, Mean =  $a + \frac{\Sigma f_i u_i}{\Sigma f_i} \times h = 57 + \frac{25 \times 3}{400}$   
 $= 57 + 0.19 = 57.19$  mangoes.

We have, Mean =  $a + \frac{\Sigma f_i u_i}{\Sigma f_i} \times h = 135 + \frac{7}{68} \times 20 = 135 + \frac{35}{17}$

Here,  $n = 68, \frac{n}{2} = \frac{68}{2} = 34,$

Here,  $l = 125, n = 68, f = 20, cf = 22, h = 20$

$$\text{Median} = l + \left( \frac{\frac{n}{2} - cf}{f} \right) \times h = 125 + \left( \frac{34 - 22}{20} \right) \times 20$$

Solution:

Class interval	Frequency	Cumulative frequency
0 - 10	5	5
10 - 20	$x$	$5 + x(c)$
20 - 30	$20(f)$	$25 + x$
30 - 40	15	$40 + x$
40 - 50	$y$	$40 + x + y$
50 - 60	5	$45 + x + y$
Total	$n = 60$	

We have  $45 + x + y = 60$  ... (i) [Given]

$$\therefore n = 60 \quad \therefore \frac{n}{2} = \frac{60}{2} = 30$$

Since the median lies in the class interval (20 - 30), so the median class is (20 - 30).

Hence,  $l = 20, f = 20, cf = 5 + x$  and  $h = 10$ .

$$\therefore \text{Median} = l + \left( \frac{\frac{n}{2} - cf}{f} \right) \times h$$

$$\Rightarrow 28.5 = 20 + \left( \frac{30 - 5 - x}{20} \right) \times 10$$

$$\Rightarrow 28.5 = 20 + \left( \frac{25 - x}{2} \right)$$

$$\Rightarrow 57 = 40 + 25 - x \Rightarrow 25 - x = 57 - 40$$

$$\Rightarrow 25 - x = 17 \quad \Rightarrow x = 25 - 17 = 8.$$

Putting  $x = 8$  in equation (i), we get:

$$\Rightarrow 45 + 8 + y = 60 \quad \Rightarrow y = 60 - 53 = 7.$$
